

3D Printed Floral Phone Case Project (Realme C55)

Objective: To design and create a customized floral phone case using 3D printing technology.

Introduction: 3D printing helps convert digital designs into real objects. In this project, a phone case is designed using CAD software and printed using a 3D printer.

Materials Required: 3D printer, filament (TPU/PLA/PETG), slicer software, CAD software, STL file.

Design Process: The phone case is designed based on Realme C55 dimensions. Floral designs are added as embossed or engraved patterns.

Working Procedure: The STL file is imported into slicer software, settings are adjusted, and the model is printed layer by layer.

Advantages: Easy customization, low cost, fast production, creative design possibilities.

Conclusion: This project shows how 3D printing can be used to create useful and attractive products easily.
